

# Jackets and Topsides for Nini and Cecilie

A huge challenge was in sight when Bladt Industries A/S in June 2002 won its biggest contract ever. An EPC contract for DONG E&P A/S comprising the manufacturing of two almost identical platforms for the development of the Nini and Cecilie Fields in the Danish part of the North Sea.

Each platform consists of a jacket and a topside of 650 tonnes. The platforms are located at 60 m of water and are designed for 10 wells. The oil from Nini and Cecilie is exported to the Siri platform, where it is processed and sent onshore. The Nini and Cecilie platforms are both unmanned and are operated from Siri. There are, however, small cabins installed on each platform, thus making it possible for operators to stay overnight in case of emergency.

The installation of the two platforms was completed within only 14 days, and a few days later Bladt Industries A/S carried out the hook-up of the wells.

Client	DONG E&P A/S
Type of contract	EPC
Weight	6,000 tonnes
Time of delivery	June 2003
Water depth	60 metres
